The Launchpad to Digital Sales: Your Next.js & Stripe Guide

Chapter : How to Create a Complete Sales Page In this chapter, we will embark on an exciting journey to create a robust sales page (payment page) from scratch. We're not just building a pretty interface; we're implementing the secure, necessary logic to process payments. The best part? We'll be using Stripe, a payment service that generously offers free transfers to kickstart your digital empire.

Step : Generating the Project

To make this process as smooth as a freshly paved road, we'll leverage the power of Manus AI, an artificial intelligence capable of generating complete, production-ready projects and delivering them neatly packaged in a **.zip** file.

In the Manus AI prompt, send the following command to summon your project:

"Create a complete sales page using NextJS and Stripe with all security principles. This page will have only two routes: the sales page, where the user chooses the payment options, and then the other route appears, which is the thank you route, and the other error routes if deemed necessary."

Once the AI wizardry is complete, download the `.zip` file, extract its contents, and open the project folder in your trusty Visual Studio Code (VSCode).

Step : Configuring Payment Credentials

Before your project can handle the sweet sound of incoming cash, we need to introduce it to your Stripe account. This is where the magic of secure integration happens.

- . Create a Stripe account by visiting their official website.
- . Hunt down the project file named `.env`, `.env.local`, or `.env.prod`. This is your secret lair for environment variables.
- . Inside this file, you'll find placeholders for variables like:
 - `STRIPE_SECRET_KEY`
 - `NEXT_PUBLIC_STRIPE_PUBLISHABLE_KEY`
 - and other necessary variables.
- . Navigate to your Stripe dashboard, copy the correct values for each of these variables, and paste them into your `.env` file. Keep these secret!

Pro Tip: If you find yourself lost in the jungle of credentials, don't panic! Copy the entire content of your `.env` file and ask an AI or an experienced developer for help. They're like digital sherpas for your code.

Step : Installing Dependencies and Running the Project

With your credentials safely tucked away, it's time to bring the project to life.

- . In VSCode, open the terminal by pressing the mystical key combination: **Ctrl + `** (Ctrl + backtick key).
- . In the terminal, execute the following command to gather all necessary components:

```
npm i
```

This command will install all project dependencies.

. Next, launch your project with:

```
npm run dev
```

or, if the stars aren't aligned:

```
npm run start
```

⚠ *Attention, Brave Developer: It is completely normal for errors to pop up. We are dealing with an automatically generated project, and sometimes the pieces need a little nudge. Check the Problems tab in VSCode, copy the errors, and use an AI to help you debug.*

Most issues are simple, like a forgotten comma or a missing credential. For more complex errors, you can always ask Manus AI to recreate the project with the specified fix—it learns fast!

Once everything is running smoothly, perform a test payment to yourself. Remember this fun fact: the funds will only be released to your Stripe account after about 30 days. This is a standard security procedure in the world of payment platforms.

Step : Publishing Your Sales Page

Your sales page is a local superstar, but it's time for the world stage! We'll use Vercel, the perfect hosting platform for Next.js projects, to get you online.

. Create a Vercel account.

- . Click on Add new project and upload your project folder.
- . Crucially, configure the environment variables in Vercel, using the exact same names and values from your local **.env** file.
- . Hit the Deploy button and watch the magic happen.

As before, deployment can sometimes be a little dramatic. If errors appear, copy the error message and the file where it occurred, paste everything into an AI, and ask for the fix. After a quick correction and a retry, your site will be published and ready to receive payments from happy customers!

Important Note: The Power of Manus AI

Manus AI is a powerful, paid tool, but it offers a generous free credits per day. Typically, the initial project creation consumes about credits. This leaves you with a buffer to ask for adjustments or more complex fixes if your project decides to be extra challenging. Use your credits wisely to keep your development flow smooth and inspired!
